

New Components and Features

We are constantly updating our products with new features based on feedback and continued research. Below are details on the newest components and features we have added since the last release.

Online Reference pages for these features are available and if you need further assistance, you can contact your account manager at vision.support@granicus.com.

visionLiveTM Enhancements

Form Builder

The Form Builder was the cornerstone of the May release, and expanding the functionality remains a high priority.

Submission Settings

The **Form Details** section has a new **Advanced Settings** section called **Submission Settings**. This new section provides additional functionality for email routing and Form submission verification.

CMS users are now able to add CAPTCHA protection for form submissions as well as send email notifications after any form is submitted. Edit the **Form Detail**, navigate to the **Advanced Settings** section, and expand the **Submission Settings** menu:

Advanced Settings (optional)

+ Payment settings
+ Form security
- Submission settings
Choose a CAPTCHA type: <input type="text" value="None"/>
Choose a notification type: <input type="text" value="None"/>
List of email address(es) <i>Note: Separate multiple addresses with semicolons(;) or commas(,)</i>
<input type="text"/>
+ Completion message

CAPTCHA Protection

The **Choose a CAPTCHA Type** dropdown offers the options for Google Invisible reCAPTCHA and reCAPTCHA v2. As a reminder, use CAPTCHA protection to prevent spam form responses from bots.

Email Notification

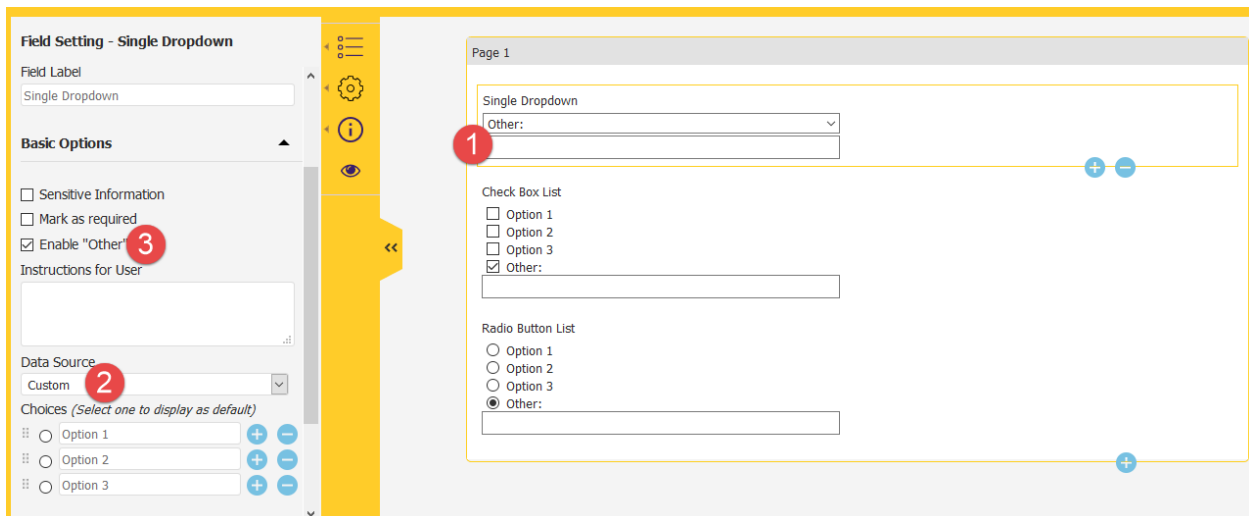

The **Choose a notification type** dropdown allows the CMS User to select one the following email types:

- **Email Alert** is a brief email that notifies the recipient that a new response has been received. This is best suited for CMS Users, as non-CMS Users will not be able to log in and view the response in full.
- **Email Summary** displays the response in full – except fields marked sensitive - in the email. If any non-CMS Users are being notified, this is the preferred notification type.
- **Email PDF Attachment** sends a link to download PDF copy of the response attached to the notification email. This delivery method is best suited if the form responses are being stored on a system outside of the CMS.

After selecting the notification type, add any recipient email addresses to the **List of email address(es)** field after a form is submitted.

“Other” Option for Multiple Choice Fields

The Form Builder now provides the ability for CMS users to enable an “Other” field in cases where the prescribed values may not necessarily reflect what the respondent would choose. This option can be enabled in the **Form Design** view by taking the following steps:

1. Add a **Single Dropdown, Check Box List, or Radio Button List** field to the Form.
2. Verify that the **Data Source** is set to **Custom**.
3. Check the **Enable “Other”** box in the **Basic Options** section.

You will now see an additional **Other:** option appended to the dropdown or list. Selecting **Other:** will display a **Single Line Text** field for a respondent to provide their answer.

Conditional Logic – URL Redirect

CMS users can now redirect form respondents to a different webpage based on their answer for a given field. The **Redirect** condition can be utilized by taking the following steps:

The screenshot shows the 'Field Setting - Single Dropdown' configuration page. On the left, the 'Conditional Logic' section is expanded, showing a 'Redirect' condition. The 'If answer:' section is set to 'Is Equal to' with 'Option 1' selected. The 'Then redirect to:' field is set to 'http://www.google.com'. The 'Condition #1' is displayed as 'If the answer is equal to Option 1, then redirect to http://www.google.com when clicking to submit.' Red numbered callouts (1-5) highlight key steps: 1. Field selection, 2. Conditional Logic expansion, 3. Internal page selection, 4. External URL entry, 5. Condition display.

1. Add a **Standard Field, Date and Time, Website, or Email** field to the Form.
2. Expand the **Conditional Logic** section, select the **Redirect** option from the dropdown, and click **Add**.
3. To redirect to an internal page, click on the **Then redirect to:** field and select the page from the dropdown.
4. To redirect to an external page, click on the **Then redirect to:** field and manually enter the absolute URL (include http://).
5. Condition is displayed below the field.

Bug Fixes:

Excluded from this list: Bugs that were both introduced and fixed since the last release (were never "live") and bugs that were specific to our development sites.

Calendar (TFS #27441)

Resolved issue with incomplete event information not being copied to Outlook events.

FAQ (TFS #27443)

Resolved issue with the select checkbox for back-end FAQ List shifting.

Forms (TFS #29013)

Forms option is now visible by CMS users in the "Online Payment Enabled Components" System Variable. Enabled "Enable Form Builder Template for CMS User" System Setting by default.

Pulse Topics (TFS #27439)

Resolved issue with broken links in the Topic Report emails for Moderators, Subscribers, and/or alternate recipients.

RAD Editor (TFS #28761)

Resolved issue with Javascript code breaking after a page is published on the front-end.

WCAG (TFS #28283)

Resolved issue with repeated ID elements for eNotification categories on the front-end.
